A4-Pattern

Printing instruction

Welcome to

bara — studiø

I'm glad you bought a pattern from Bara Studio. To make sure the pattern is sized correctly, I explain you how to print your A4 pattern on your home printer.

Schnitt drucken

How to choose the right printer

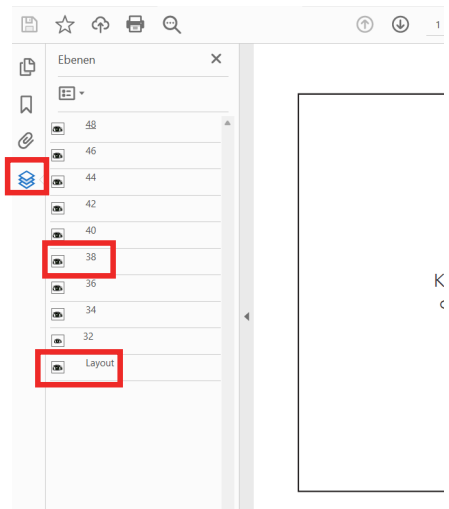

You can print the A4 PDF pattern from the comfort of your home. The A1 and A0 PDF patterns are intended for large-format printing, which you can have plotted in a copy store. Plotting is especially recommended for larger pattern files or large pattern pieces. However, you have to wait a few days for the print and it will cost you about 5 Euros depending on the consumption. You can then simply cut out or trace the pattern. The A4 file sometimes costs a little more work. But you can easily print it out at home with a standard printer. You glue the pages together in an intermediate step before you cut out the pattern.

Step 1: Download the A4 pattern and open it with Acrobat Reader. You can find a free version of this pdf reader here: <https://get.adobe.com/de/reader>

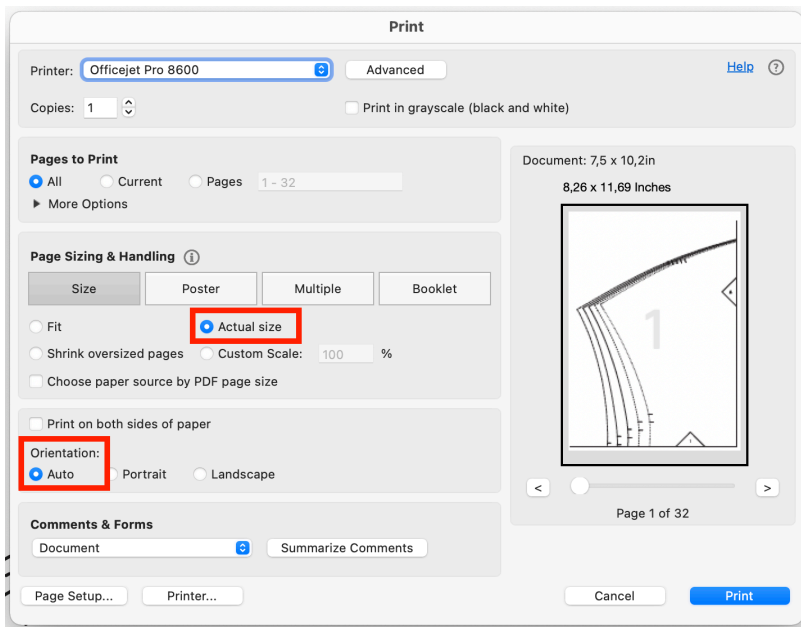

Layer printing of the DinA4 PDF pattern file

So that you don't have a tangle of lines, you can show and hide sizes in the A4 files. So you have the possibility to print only your selected size.

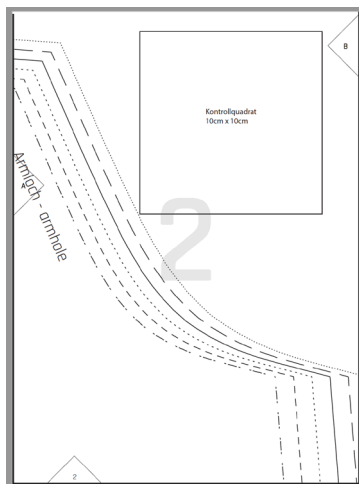

In Adobe Acrobat Reader you will find the individual sizes on different layers in the left sidebar. The „eye“ indicates that the respective layer is shown. If you click on it, the eye disappears and the corresponding size becomes invisible. So choose only your own size for printing and be sure to leave the layout hidden.

Step 2: Check your print settings. The setting „Actual size“ must be activated so that the pattern is printed in the correct size. You may also need to set the orientation to „Auto“ so that the pattern is printed in portrait format.

Step 3: First print the page with the test square. It is on one of the first pages. When you have printed this page, measure the square and check if it is 10 x 10 cm. A size difference of +/- 0.2 cm is acceptable.

Step 4: If the square is sized correctly, you can print all the other pages.

If the square is too small or too big, check again if your settings are correct. The pattern should preferably be printed from a laptop/PC, as there are often difficulties when printing from a cell phone.

Step 5: Cut away the bottom and the right edges of each sheet, then tape together the same letters on the long sides (A to A, B to B, etc.) and the same numbers on the short sides (1 to 1, 2 to 2, etc.). I like to use scotch tape for this.

Step 6: Once you have taped all the pages together, you can cut out the pattern pieces accordingly. To do this, determine your size, select the appropriate line, and then cut out the pattern pieces along that line.
